# 1 Introduction

This document mainly introduces how to use the QLog tool to catch log data from Quectel modules in Linux and Android systems.

## 1.1. Applicable Modules

**Table 1: Applicable Modules**

Module Series	Models
LTE	UMTS/HSPA(+)
	● UCxx: UC15/ UC20/ UC200T
	● EC2x: EC21/ EC25/ EC20 R2.0/ EC20 R2.1
	● EG9x: EG91/ EG95
	● EM05
	● EG25-G
	Automotive
LPWA	● AGxx: AG35/ AG15/ AG520R/ AG550Q
	● BGxx: BG96/ BG95/ BG77
LTE-A	● BCxx: BC69/ BC600L-M3
	● Ex06: EG06/ EP06/ EM06
	● Ex12: EG12/ EM12
	● EG18
5G	● EM20
	● Rx500Q: RG500Q/ RM550Q
	● Rx510Q: RG510Q/ RM510Q

# 2 Tool Package

QLog tool package includes source codes and filter configuration files.

The files in the tool package are shown as below:

- *main.c asr.c mdm.c sahara.c tty2tcp.c*
- *conf/\*.cfg*

*conf/\*.cfg* are filter configuration files.

## NOTES

1. Before running the QLog tool, please make sure the USB virtual ports have readable and writable permissions.
2. UC200T does not need filter configuration files.

# 3 Introduction on Ports

Before using QLog tool in Linux & Android systems, please ensure that USB driver of the module has been installed successfully in host system. After the module has been connected to the host via USB cable, the corresponding USB virtual ports will be displayed, which are listed as below.

- ttyUSB0-----DM port
- ttyUSB1-----NEMA port
- ttyUSB2-----AT port
- ttyUSB3-----Modem port

**NOTES**

1. QLog tool catches log data through the DM port.
2. The descriptors of USB virtual ports listed above are on the condition that host is not connected to other USB virtual port devices, i.e., host is only connected to Quectel module.

The following command can be put in Linux console to query whether the USB virtual ports exists.

```
ls -al /dev/ttyUSB*
```

# 4 Command Arguments of QLog Tool

The operating arguments in the command lines of QLog program can be specified, and the detailed arguments are illustrated as below.

**Table 2: Description of Command Arguments**

Number	Argument	Optional/ Non-optional	Description
1	-p <port>	Optional	Port. <port> can be specified as /dev/ttyUSB*, and the default port is /dev/ttyUSB0.
2	-m <size>	Optional	The max size of a single file to be saved. Unit: MB. Default: 128. Range: 2~512.
3	-n <number>	Optional	The max number of log files to be saved. Default: 0. Range: 0~512. “0” means no limit, and other values mean QLog will automatically delete the oldest log file when the number exceeds max number.
4	-s <path>	Optional	The path to save the log data file. If this argument is set as 9000, QLog will automatically work in TCP server mode, and TCP port is 9000. Then Windows tools like QPST <sup>1)</sup> , QWinLog <sup>2)</sup> and CatStudio <sup>1)</sup> can be connected to this TCP port to catch log. When modules enter MDM dump state, QLog will automatically catch MDM dump.
5	-f <filename>	Optional	The name of the filter configuration file. If this argument is not set, default configuration embedded in QLog will be used. (UC200T does not need configuration file.)

**NOTES**

1. <sup>1)</sup> QPST(Qualcomm Product Support Tool) and CatStudio tools can be used without licensing if needed.
  2. <sup>2)</sup> QWinLog is Quectel's tool and can be provided for customers if needed.
-

# 5 How to Use QLog Tool

This chapter mainly introduces the procedure of using QLog tool in Linux and Android systems.

QLog tool can catch log data from the module in real time and save it into any directory of customer's device. The log data can be used to analyze the abnormality of the module.

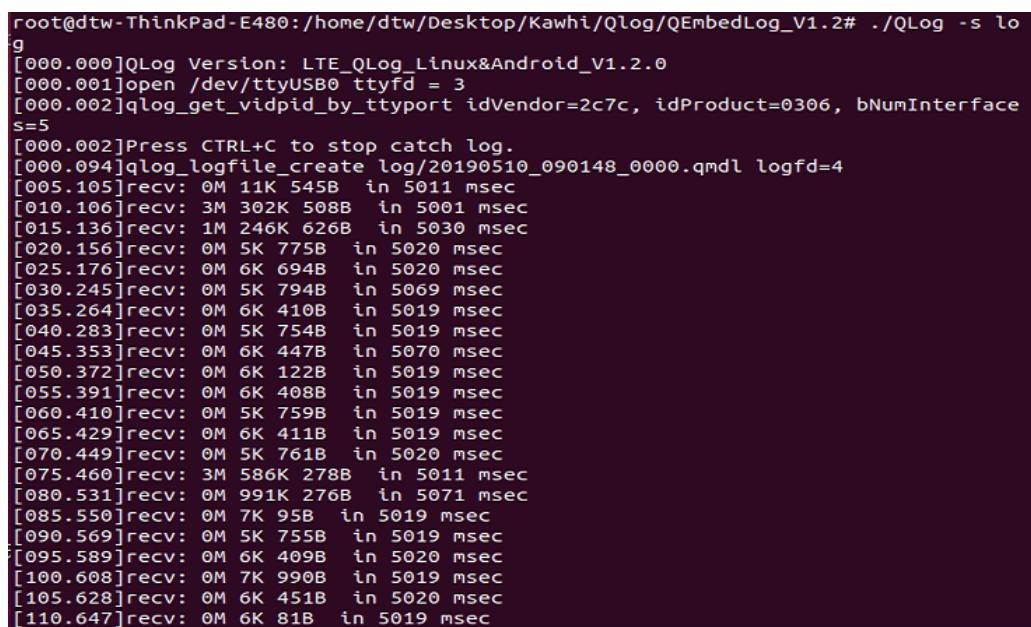

## 5.1. Linux

In Linux system, the source codes of the tool need to be compiled with the following command:

```
make CROSS_COMPILE=<your platform's cross compiler>
```

After compilation, put the QLog tool and the filter configuration files into a directory of customer's device. Then run the tool to catch log or dump according to their requirements.

### 5.1.1. Catch Log to Local Disk
